

What is claimed is:

1 1. A method for transmit power adjustment in radio
2 frequency systems, comprising the steps of:
3 detecting output power of a transmit channel;
4 generating an input value substantially indicative of
5 the output power;
6 determining if the input value falls within a desired
7 range;
8 computing an output value based on a difference
9 multiplied by a predetermined factor if the input
10 value is out of the desired range, where the
11 difference is between the input value and a
12 target value substantially corresponding to
13 desired output power of the transmit channel;
14 adjusting the output power for the transmit channel in
15 accordance with the output value; and
16 repeating the above steps until the input value is
17 within the desired range.

1 2. The method as recited in claim 1 wherein the
2 predetermined factor is dictated by a ratio between a first
3 slope of the output value versus the output power and a
4 second slope of the input value versus the output power.

1 3. The method as recited in claim 2 wherein the
2 adjusting step comprises controlling a variable gain
3 amplifier of a transceiver in accordance with the output
4 value.

1 4. The method as recited in claim 3 wherein the
2 detecting step detects the output power from a power
3 amplifier subsequent to the transceiver.

1 5. A method for transmit power adjustment in radio
2 frequency systems, comprising the steps of:
3 detecting output power of a transmit channel;
4 generating an input value substantially indicative of
5 the output power;
6 computing an output value based on a difference
7 multiplied by a predetermined factor, where the
8 difference is between the input value and a
9 target value substantially corresponding to
10 desired output power of the transmit channel; and
11 adjusting the output power for the transmit channel in
12 accordance with the output value.

1 6. The method as recited in claim 5 wherein the
2 predetermined factor is dictated by a ratio between a first
3 slope of the output value versus the output power and a
4 second slope of the input value versus the output power, in
5 which the output power is in logarithmic scale.

1 7. The method as recited in claim 6 wherein the
2 adjusting step comprises controlling a variable gain
3 amplifier of a transceiver in accordance with the output
4 value.

1 8. The method as recited in claim 7 wherein the
2 detecting step detects the output power from a power
3 amplifier subsequent to the transceiver.

1 9. An apparatus for transmit power adjustment in radio
2 frequency systems, comprising:
3 a detector adapted to detect output power of a transmit
4 channel;
5 an input module coupled to the detector, for generating
6 an input value substantially indicative of the
7 output power;
8 an output module for accepting an output value that is
9 used to adjust the output power; and
10 means for computing the output value based on a
11 difference multiplied by a predetermined factor,
12 where the difference is between the input value
13 and a target value substantially corresponding to
14 desired output power of the transmit channel.

1 10. The apparatus as recited in claim 9 wherein the
2 predetermined factor is dictated by a ratio between a first
3 slope of the output value versus the output power and a
4 second slope of the input value versus the output power.

1 11. The apparatus as recited in claim 9 wherein the
2 computing means comprises a look-up table storing a
3 plurality of predetermined factors for respective channel
4 frequencies.

1 12. The apparatus as recited in claim 10 further
2 comprising:
3 a power amplifier; and

4 a transceiver coupled between the output module and the
5 power amplifier, having a variable gain amplifier
6 responsive to the output value;
7 wherein the detector is adapted to detect the output
8 power from the power amplifier.

1 13. The apparatus as recited in claim 12 wherein the
2 output power emitted from the power amplifier varies
3 substantially linearly with the output value for the
4 transceiver, in which the output power is in logarithmic
5 scale.

1 14. The apparatus as recited in claim 13 wherein the
2 input value varies substantially linearly with the output
3 power detected by the detector, in which the output power is
4 in logarithmic scale.
